Executive Summary

TĀKAPU FOREST

Tākapu Forest is a Wellington forestry asset combining immediate harvest income, carbon value, and long-term landholding potential. Located approximately 16 kilometres from both Wellington City and CentrePort Wellington, the property offers excellent access to one of the Southern North Island’s principal export log ports.

The property comprises approximately 235 hectares of freehold land, including approximately 49ha of mature radiata pine ready for harvest and a further 117ha of minimally tended radiata pine suited to carbon forestry. Approximately 7 hectares adjoining Tākapu Road provides direct access to the property and may offer future development potential, subject to the necessary approvals. With 133.8ha registered in the ETS under the stock change accounting method, the property provides ongoing carbon sequestration and immediate cashflow.

Preliminary harvest inventory has been prepared for the mature crop, while all NZUs associated with the property’s NZ ETS registration remain with the forest and will transfer to the purchaser on settlement.

Tākapu Forest presents a rare opportunity to acquire a forestry asset within close proximity to Wellington, offering a combination of immediate harvesting, ongoing carbon income, and long-term land value in a tightly held location.

FOR SALE - BY TENDER

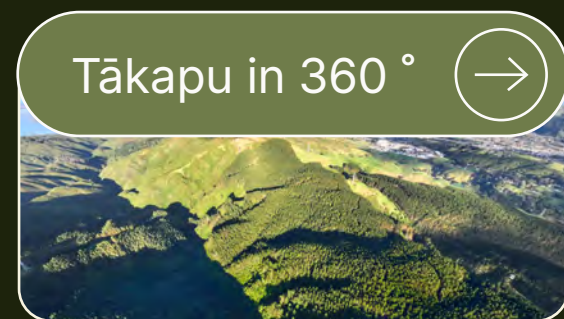

(UNLESS SOLD PRIOR)

Any enquiries in relation to this sale to be directed to Warwick Searle, George Cashmore or James Burke of Searle Forestry, including clarification or interpretation of any matters within this request for sale, and inspections are strictly by appointment only.

Note: Prospective purchasers are encouraged to obtain independent legal, financial, forestry, and regulatory advice.

Forestry Overview

Tākapu Forest comprises approximately 166.8 hectares of established radiata pine, spanning establishment years from 1984 to 1996. Separated into two primary areas, Tākapu offers a combination of ready-to-harvest stands on the lower-western portion of the block with 49.1ha of both 1984, 1995 and 1996, pruned stands and the upper eastern portion of the property with approximately 117.76ha of minimally tended, mature stands primed for ongoing carbon sequestration.

Preliminary inventory has been prepared for the mature crop along with a desktop harvest proposal for the lower-western stands. The estimated total recoverable volume across the pruned stands is 583.7m³/ha with the crop standing at an average of 428 stems per hectare. The balance of the forest, primarily suited to carbon sequestration has not been pruned and minimally tended, now standing at an average of 746 SPH.

Approximately 133.8 hectares are registered in the New Zealand Emissions Trading Scheme (NZ ETS) under the stock change accounting method, with all associated NZUs transferring to the purchaser on settlement.

Supported by dual road access, established internal roading and a location approximately 16 kilometres from CentrePort Wellington, Tākapu Forest is well positioned for efficient harvesting and long-term management, with direct access to one of the Southern North Island’s principal export log ports.

Easement access is granted to Transpower for maintenance of the powerlines along with informal agreement for the maintenance of a cell tower, positioned near the north-east boundary. Both parties have obligations for maintaining the road access.

Land Use Capability

Aspect

Environmental Risk

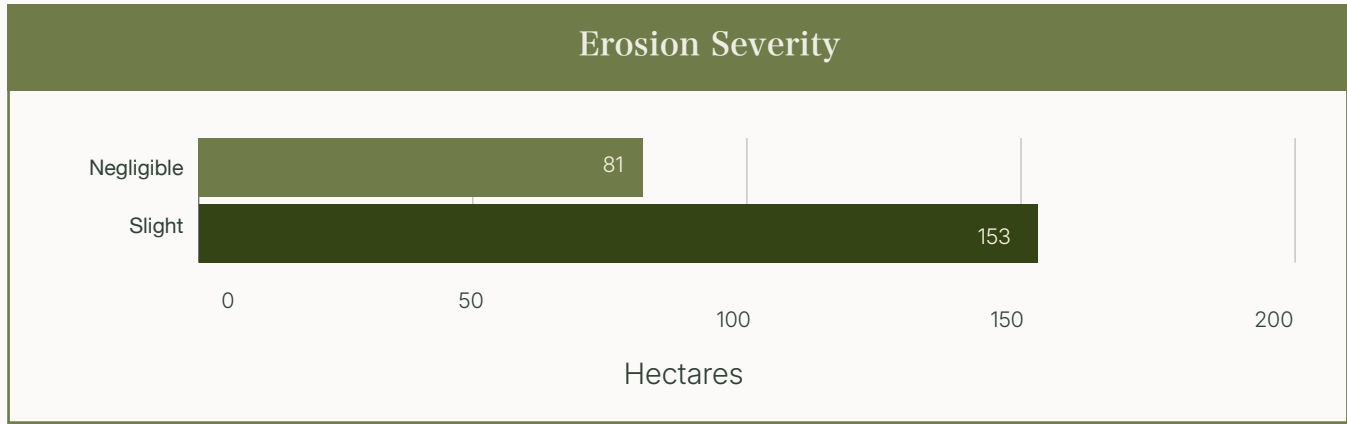

The major regulations affecting environmental management of plantation forests in New Zealand are the National Environmental Standards for Commercial Forestry (NES-CF). The key areas covered under the NES-CF are erosion risks, water quality, water habitat and wilding tree risks.

Erosion Susceptibility Class

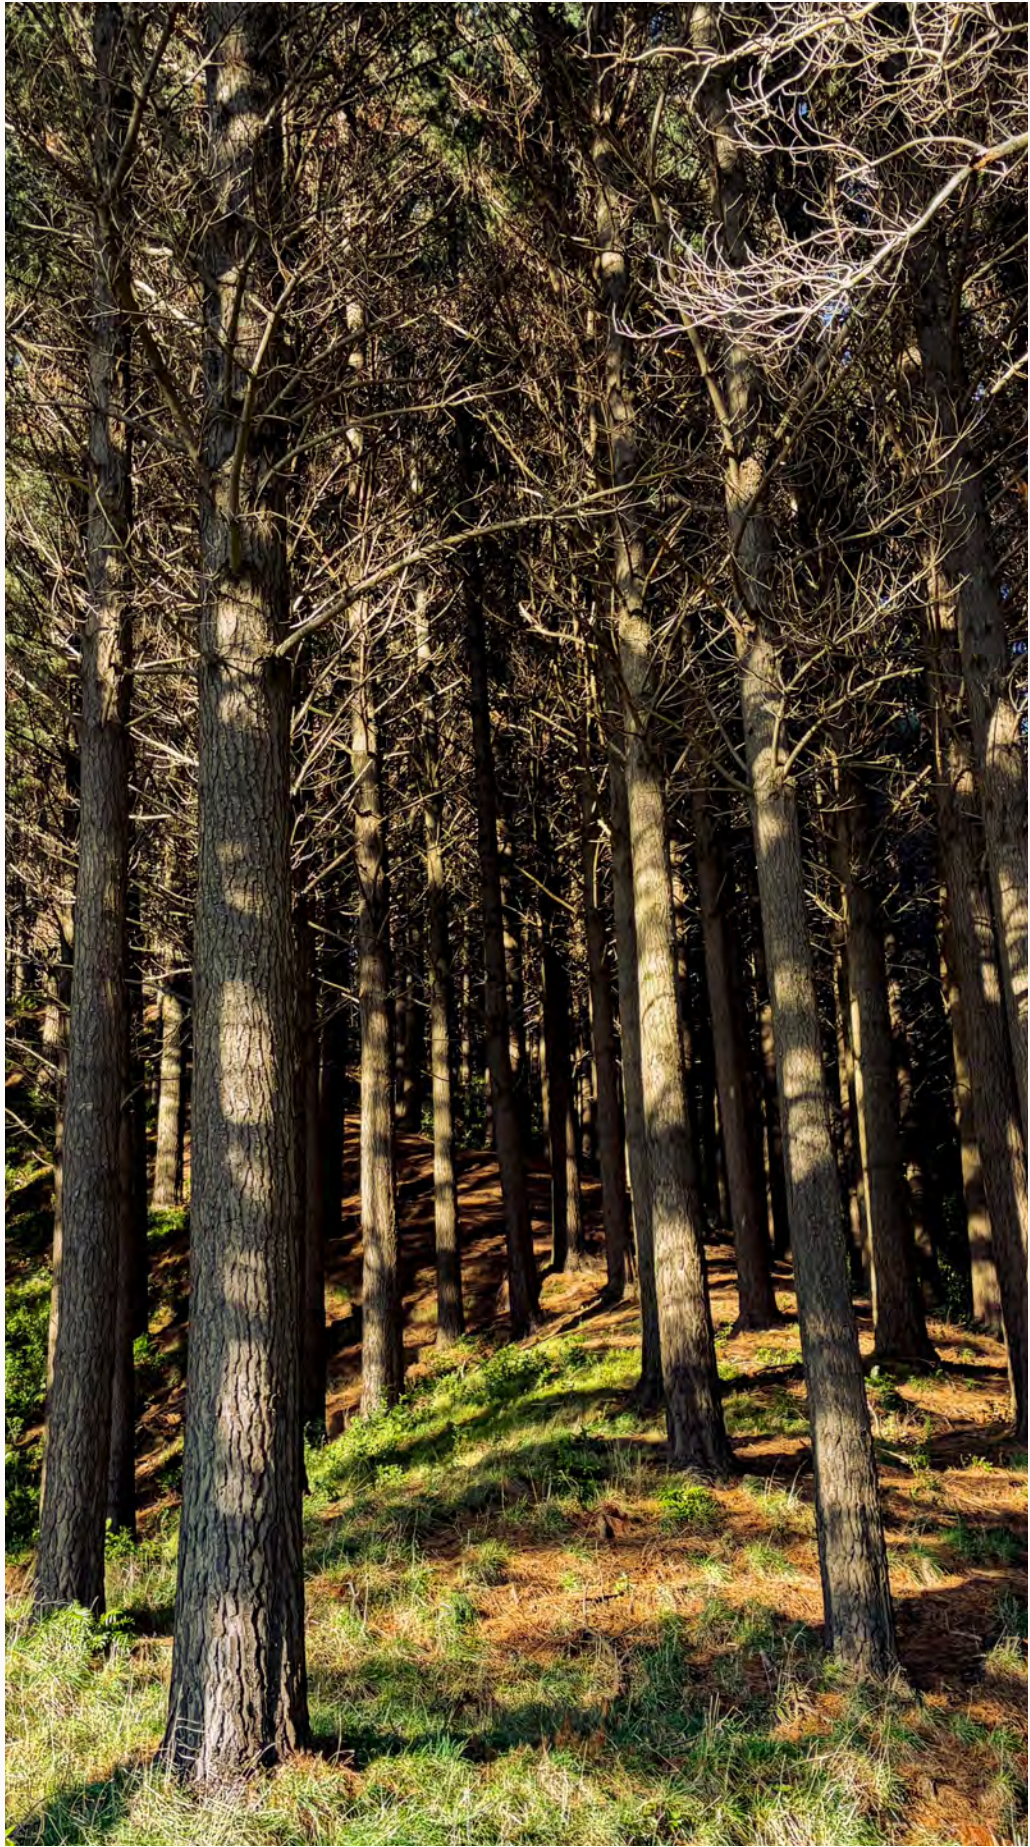

Tākapu Forest land is classed as Low and Moderate as sourced from the MPI NES-CF Erosion Susceptibilities Classification (ESC).

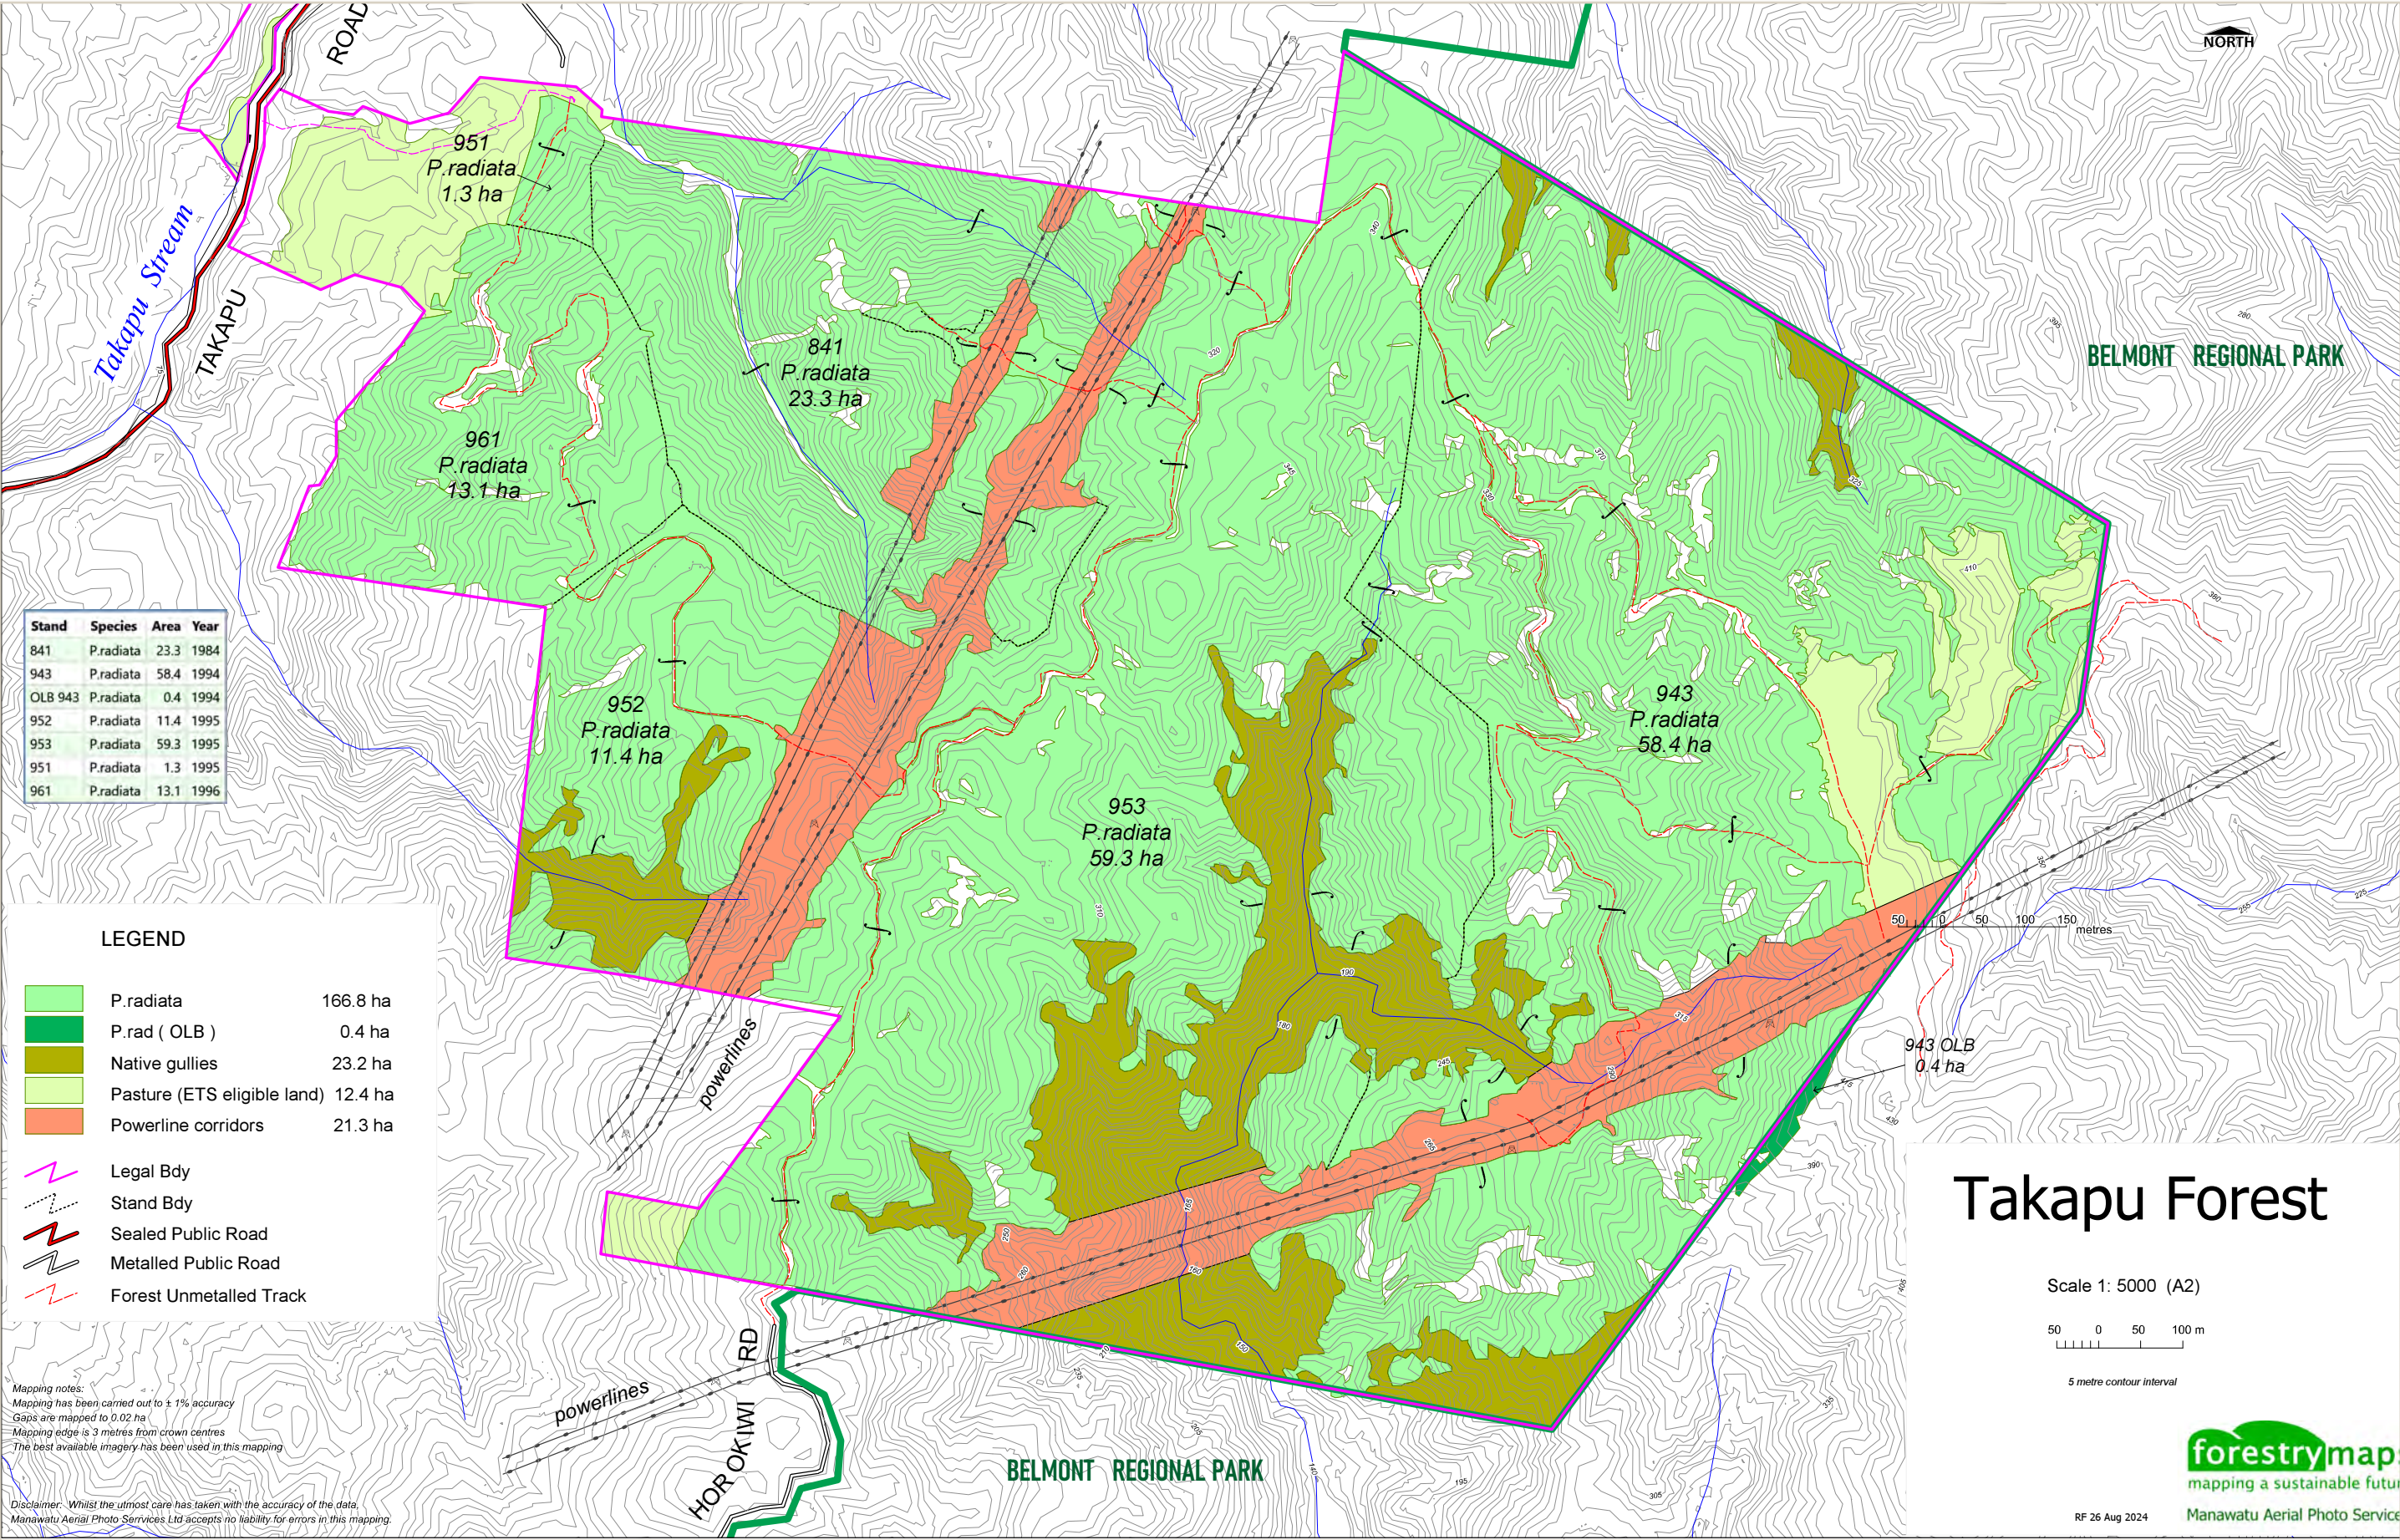

Fish Spawning

Waterways within or adjoining Tākapu Forest has modelled fish spawning probability for Group A Banded Kokopu (*Galaxias fasciatus*).

Environmental risk data has been sourced from the Ministry for Primary Industries (MPI) geospatial portal.

Location

Tākapu Forest is strategically located in Grenada North, approximately 16 kilometres from CentrePort Wellington, the Southern North Island’s principal export log port. Direct access to State Highway 1 provides efficient transport links to both export and domestic timber markets, supporting cost-effective harvesting and log transport.

In addition to CentrePort Wellington, domestic processing facilities in Masterton and Dannevirke provide further marketing options for future harvests. The property’s proximity to established transport infrastructure and key processing destinations enhances operational efficiency and provides flexibility when bringing timber to market.

Emissions Trading Scheme

Tākapu Forest is registered under New Zealand’s Emissions Trading Scheme (ETS) on a stock change basis, meaning the forest earns New Zealand Units (NZUs) as carbon is sequestered through the growing cycle. NZUs can be sold on the open market, providing an additional income stream alongside timber revenues.

Tākapu Forest has 133.8ha registered across 7 carbon accounting areas (CAAs) with approximately 36.9ha being pre-1990 forest.

A total of 70,772 NZUs are currently held in the ETS account and will be available to be purchased and able to be transferred to the purchaser as part of the sale. With the combination of pre-1990 and post-89 registered forest land, Tākapu benefits from dual income streams through ongoing carbon sequestration with harvest upside also.

A PURCHASER MAY HAVE A NUMBER OF PATHWAYS AVAILABLE UNDER THE ETS:

HARVEST AND RE-ESTABLISHMENT

The forest is harvested in accordance with the planned rotation schedule. NZUs must be surrendered at harvest to account for the carbon released. Once the forest is re-established, the sequestration and earning cycle recommences, generating new NZUs over the following rotation.

PERMANENT CARBON FORESTRY

The forest is managed as a permanent crop rather than a harvest rotation. Under this approach, NZUs continue to accrue indefinitely without a surrender obligation, offering a long-term carbon income strategy. This option foregoes timber revenue but may suit investors with a strong carbon focus, particularly given the growing demand for high-integrity carbon units.

PAIRED PORTFOLIO STRATEGY

For buyers with existing ETS-registered forests, integrating Tākapu into a broader carbon portfolio may unlock additional value through the management of surrender obligations and sequestration timing across multiple properties.

CONTINUE UNDER THE STOCK CHANGE APPROACH

Tākapu’s ETS stands remain registered under the stock change accounting method, keeping full optionality open. NZUs continue to accrue as the crop grows, with no obligation to commit to a permanent regime or lock in a harvest date. Should market conditions or investment strategy call for it, the owner retains the ability to switch to timber production at any time, simply surrendering units in the ordinary course as the crop is harvested — offering the flexibility of a carbon income stream today without foreclosing on future harvest revenue.

Note: Full ETS account details, including current unit holdings, registration history, and projected sequestration, are available to registered parties through the private data room.
