# Executive Summary

## HUNTINGWOOD FOREST

Huntingwood Forest is a mature forest asset located west of Tolaga Bay within the heavily forested area of Tauwhareparae in Gisborne. The property combines mature clearwood harvest income, carbon value, and long-term landholding potential. With established and economical access to Eastland Port in Gisborne, one of the East Coast's principal export log ports makes Huntingwood Forest an attractive, harvest ready investment.

The property comprises approximately 331.57ha of freehold land, supporting approximately 207.8ha of net stocked radiata pine established across six stands in 1995 and 1996. The entire crop has been managed under a clearwood pruning regime, positioning the forest to deliver high-value pruned logs at harvest. With the oldest stands now aged 31 years, the crop is at optimum harvest age, offering purchasers immediate harvest cashflow.

With 77.9 hectares of the forest is registered in the NZ Emissions Trading Scheme under the stock change accounting method, provides ongoing carbon sequestration and transferable NZU entitlements. This can provide immediate capital relisation through trading NZUs benefiting from both harvest and carbon income.

Huntingwood Forest presents an opportunity to acquire a fully established, clearwood-regime radiata forest in the Gisborne region, offering a combination of immediate harvesting, ongoing carbon income, and long-term land value in the productive East Coast location, famed for NZ's best growth rates!

## FOR SALE - BY NEGOTIATION

Any enquiries in relation to this sale to be directed to Warwick Searle, George Cashmore or James Burke of Searle Forestry, including clarification or interpretation of any matters within this request for sale, and inspections are strictly by appointment only.

# Forestry Overview

Huntingwood Forest is a mature age-class radiata pine forest covering a NSA of 207.87ha across two distinct parcels, 17ha and 190.87ha respectively. The crop was established in consecutive planting seasons (1995 and 1996) and managed throughout under a clearwood pruning regime. The crop is uniformly mature at 30 and 31 years, simplifying harvest planning and cashflow modelling. All six stands are managed around creating a single harvest window proposition.

From a harvest perspective, a key value driver is the clearwood regime undertaken through the forest producing a premium grade log. In a region where significant plantation area is unpruned or minimally tended, a fully pruned estate is comparatively scarce and positions the forest for a higher-value log mix at harvest.

The property benefits from documented easement access, with registered easements  providing legal right-of-way across neighbouring land to the each forest parcel. This de-risks the most common operational constraint in East Coast forestry — securing legal cartage routes to the public road network — and means a purchaser can mobilise harvest without first negotiating access arrangements with adjoining landowners. This is also beneficial from existing harvest synergies with adjacent blocks.

## Stand Summary

| STAND | SPECIES | PLANTED | HECTARES |
|---|---|---|---|
| 1/6 | P. Radiata | 1995 | 21.15 |
| 1/5 | P. Radiata | 1995 | 25.33 |
| 1/4 | P. Radiata | 1995 | 32.64 |
| 1/3 | P. Radiata | 1995 | 58.07 |
| 1/2 | P. Radiata | 1995 | 53.68 |
| 1/1 | P. Radiata | 1996 | 17.00 |

## Land Use Capability

## Aspect

# Environmental Risk

The major regulations affecting environmental management of plantation forests in New Zealand are the National Environmental Standards for Commercial Forestry (NES-CF). The key areas covered under the NES-CF are erosion risks, water quality, water habitat and wilding tree risks.

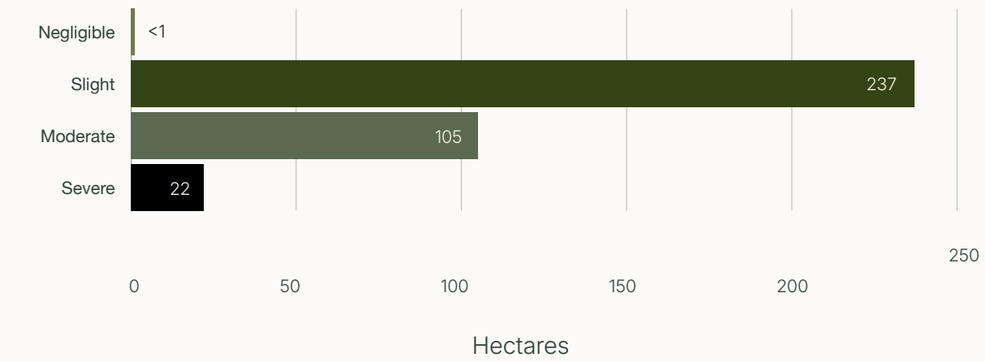

## Erosion Susceptibility Class

Huntingwood Forest land is classed as Moderate and Very High as sourced from the MPI NES-CF Erosion Susceptibilities. Classification (ESC).

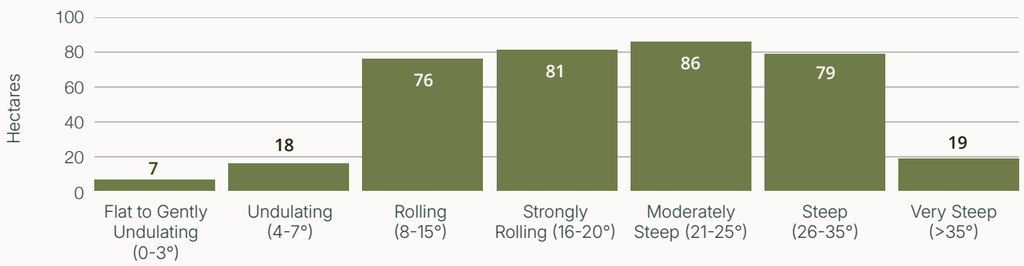

## Fish Spawning

Any waterways within or adjoining Huntingwood Forest are not shown as being fish spawning habitats. Forestry activities around any waterway are not expected to be restrictive from this perspective.

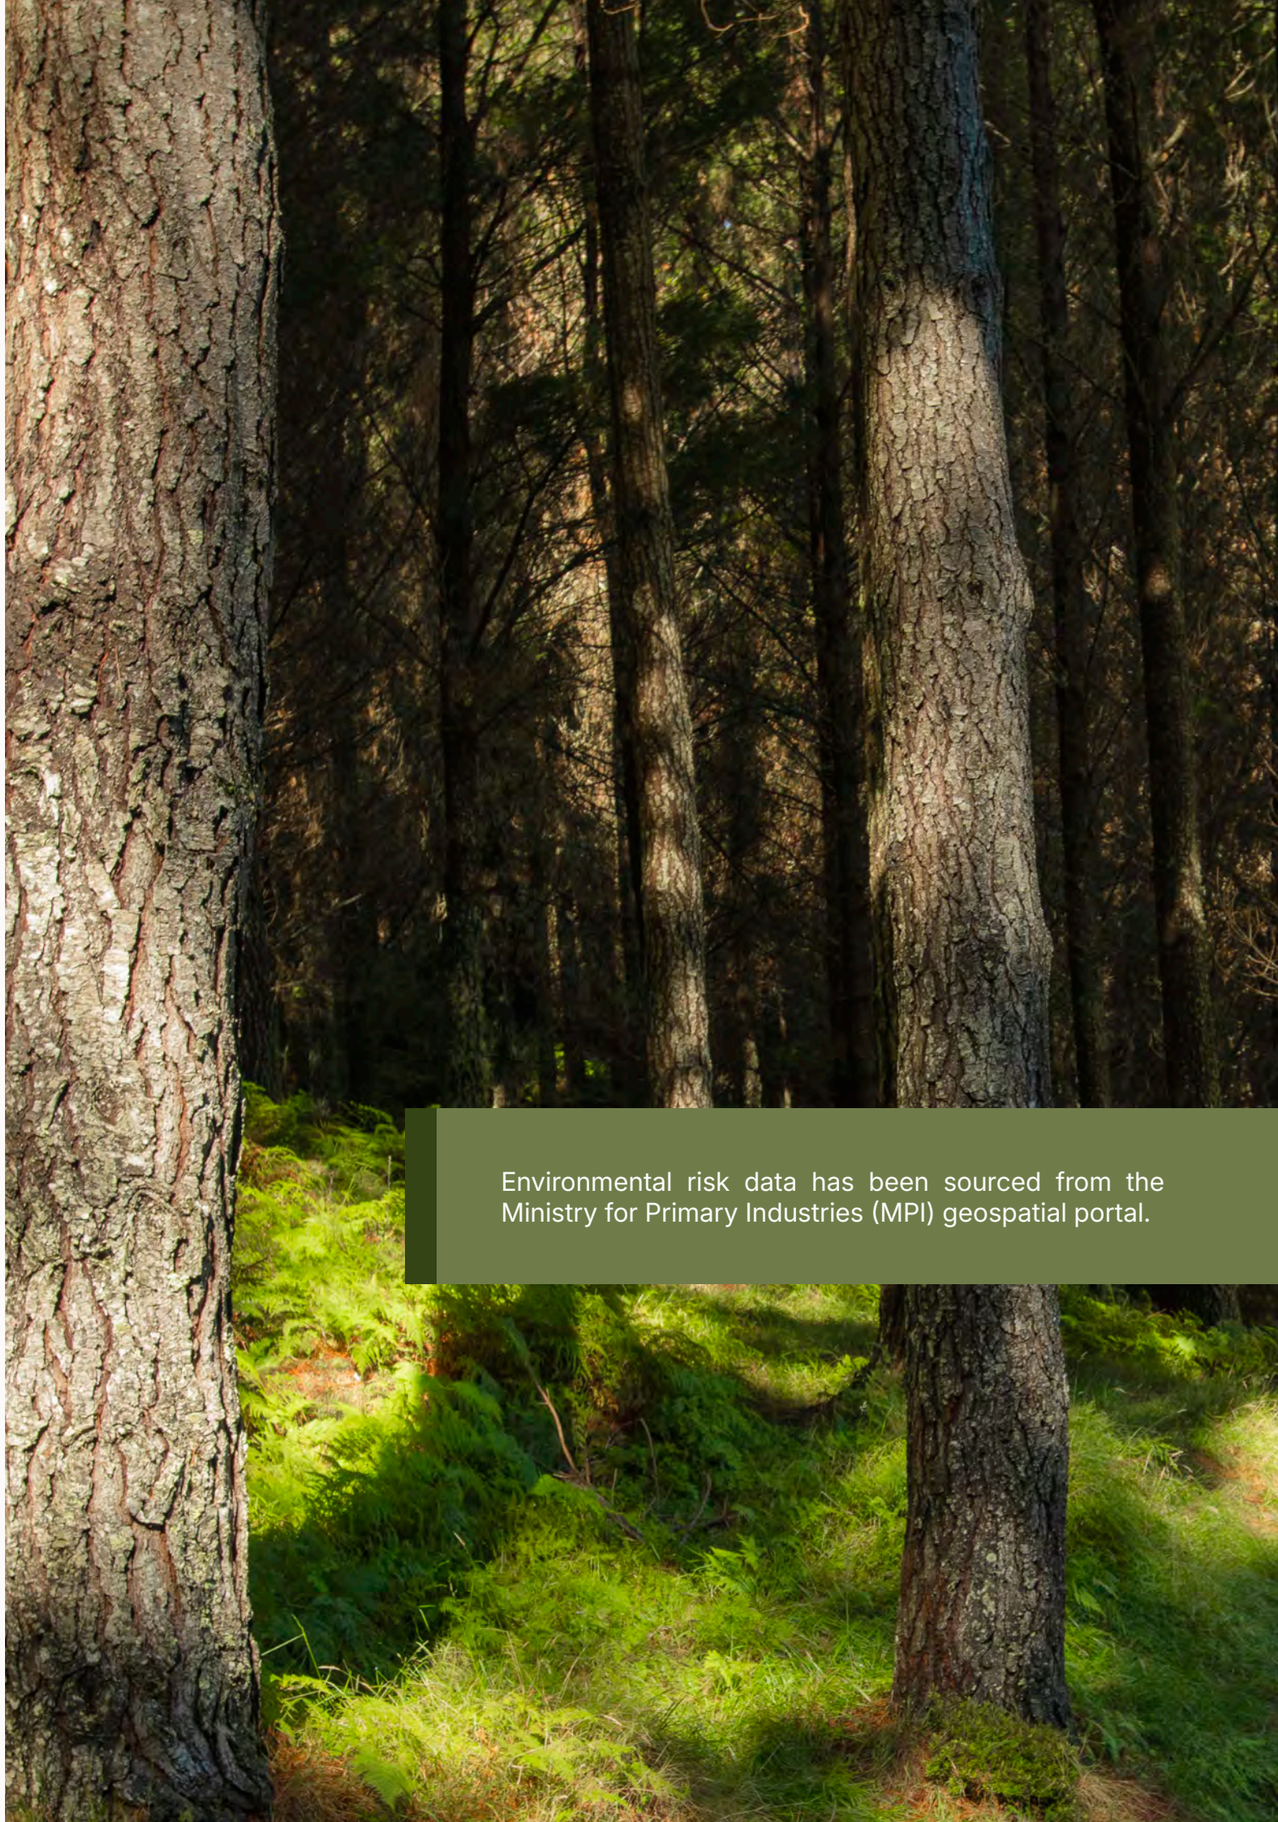

## Erosion Severity

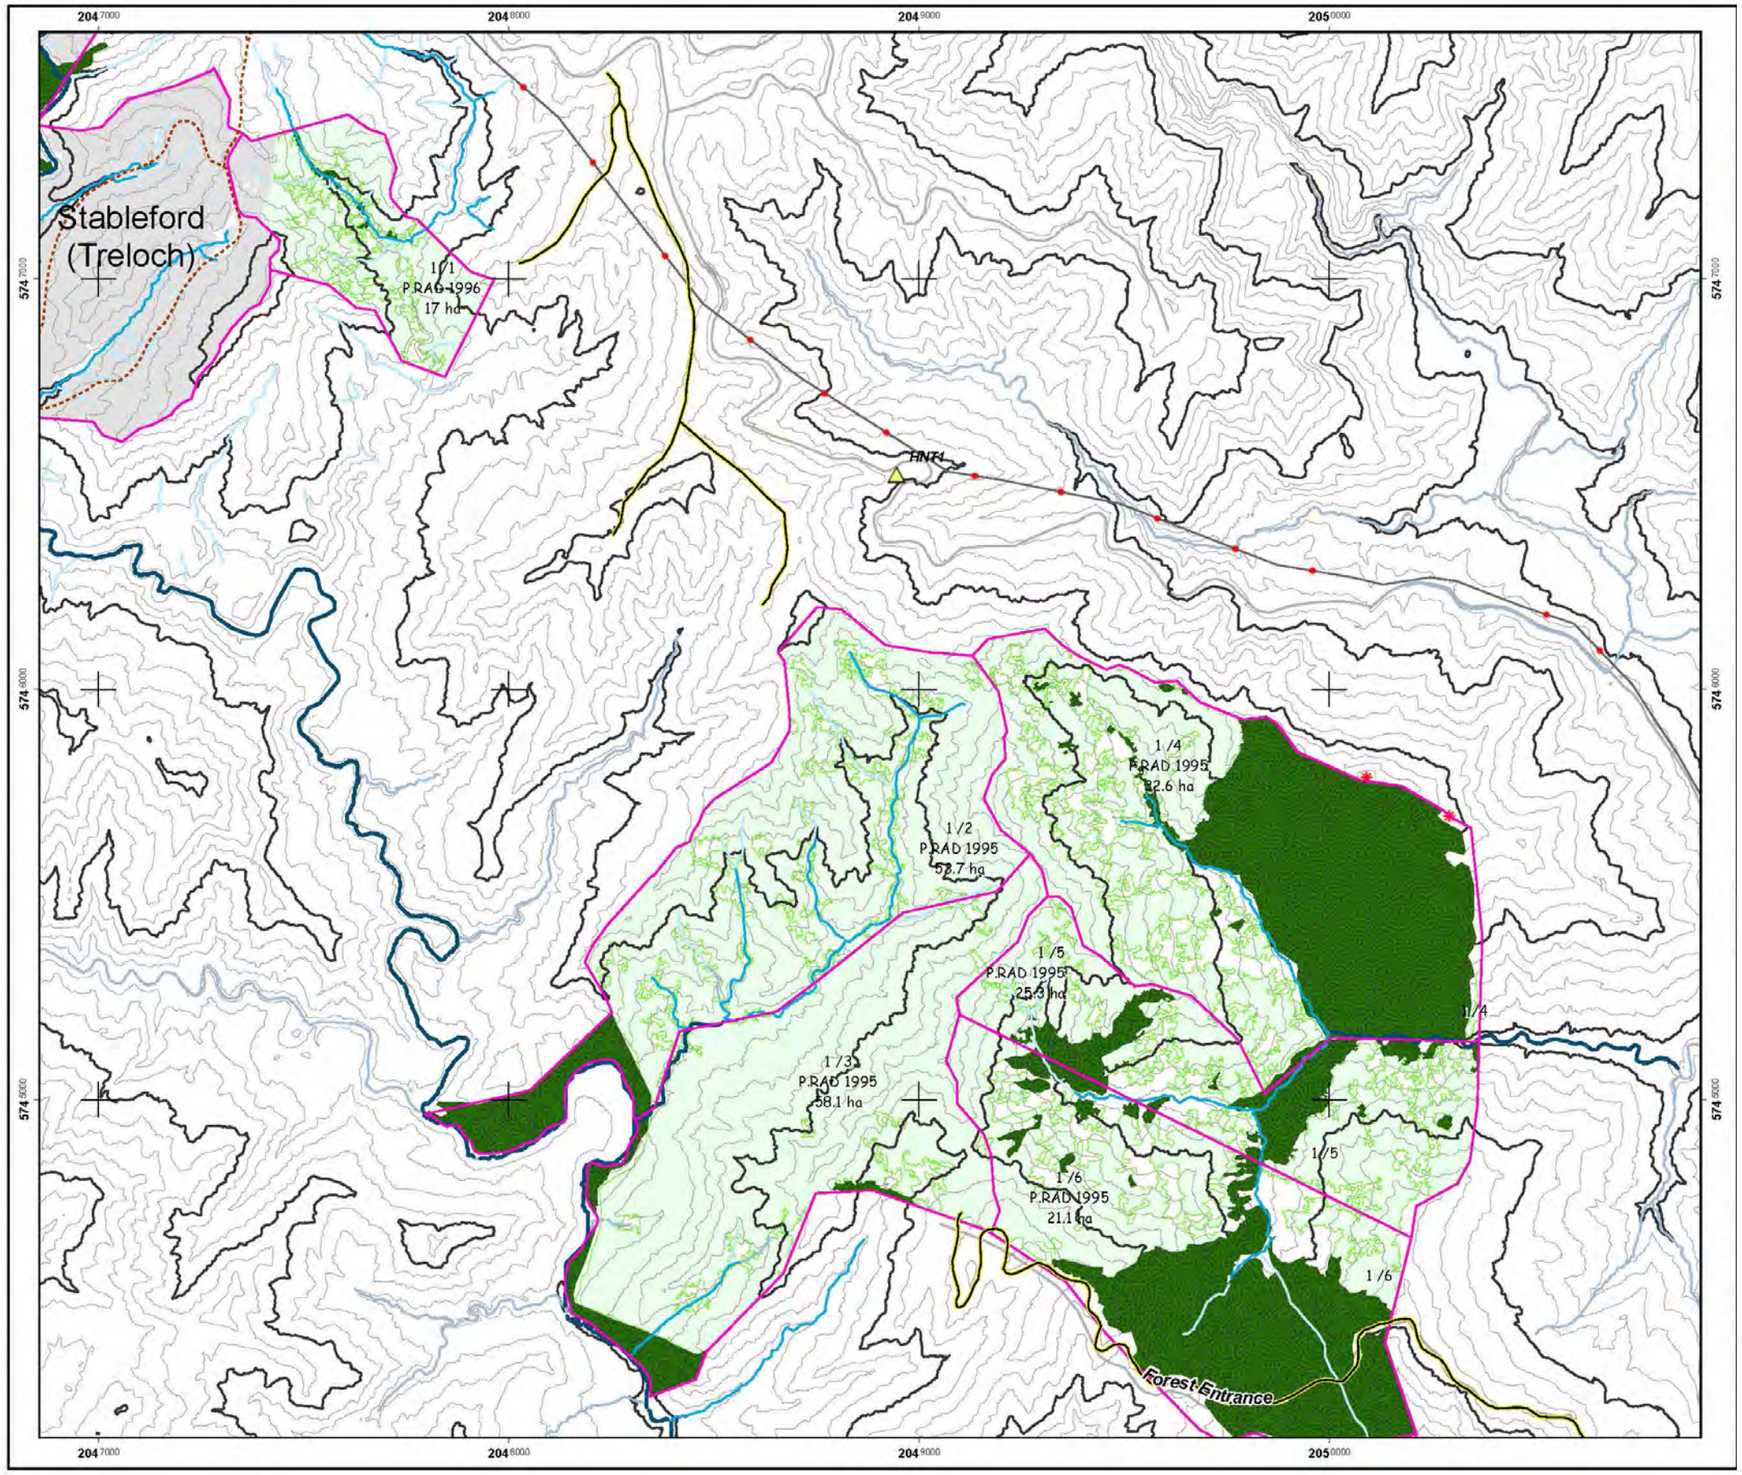

## Steepness of Slope

Environmental risk data has been sourced from the Ministry for Primary Industries (MPI) geospatial portal.

# Location

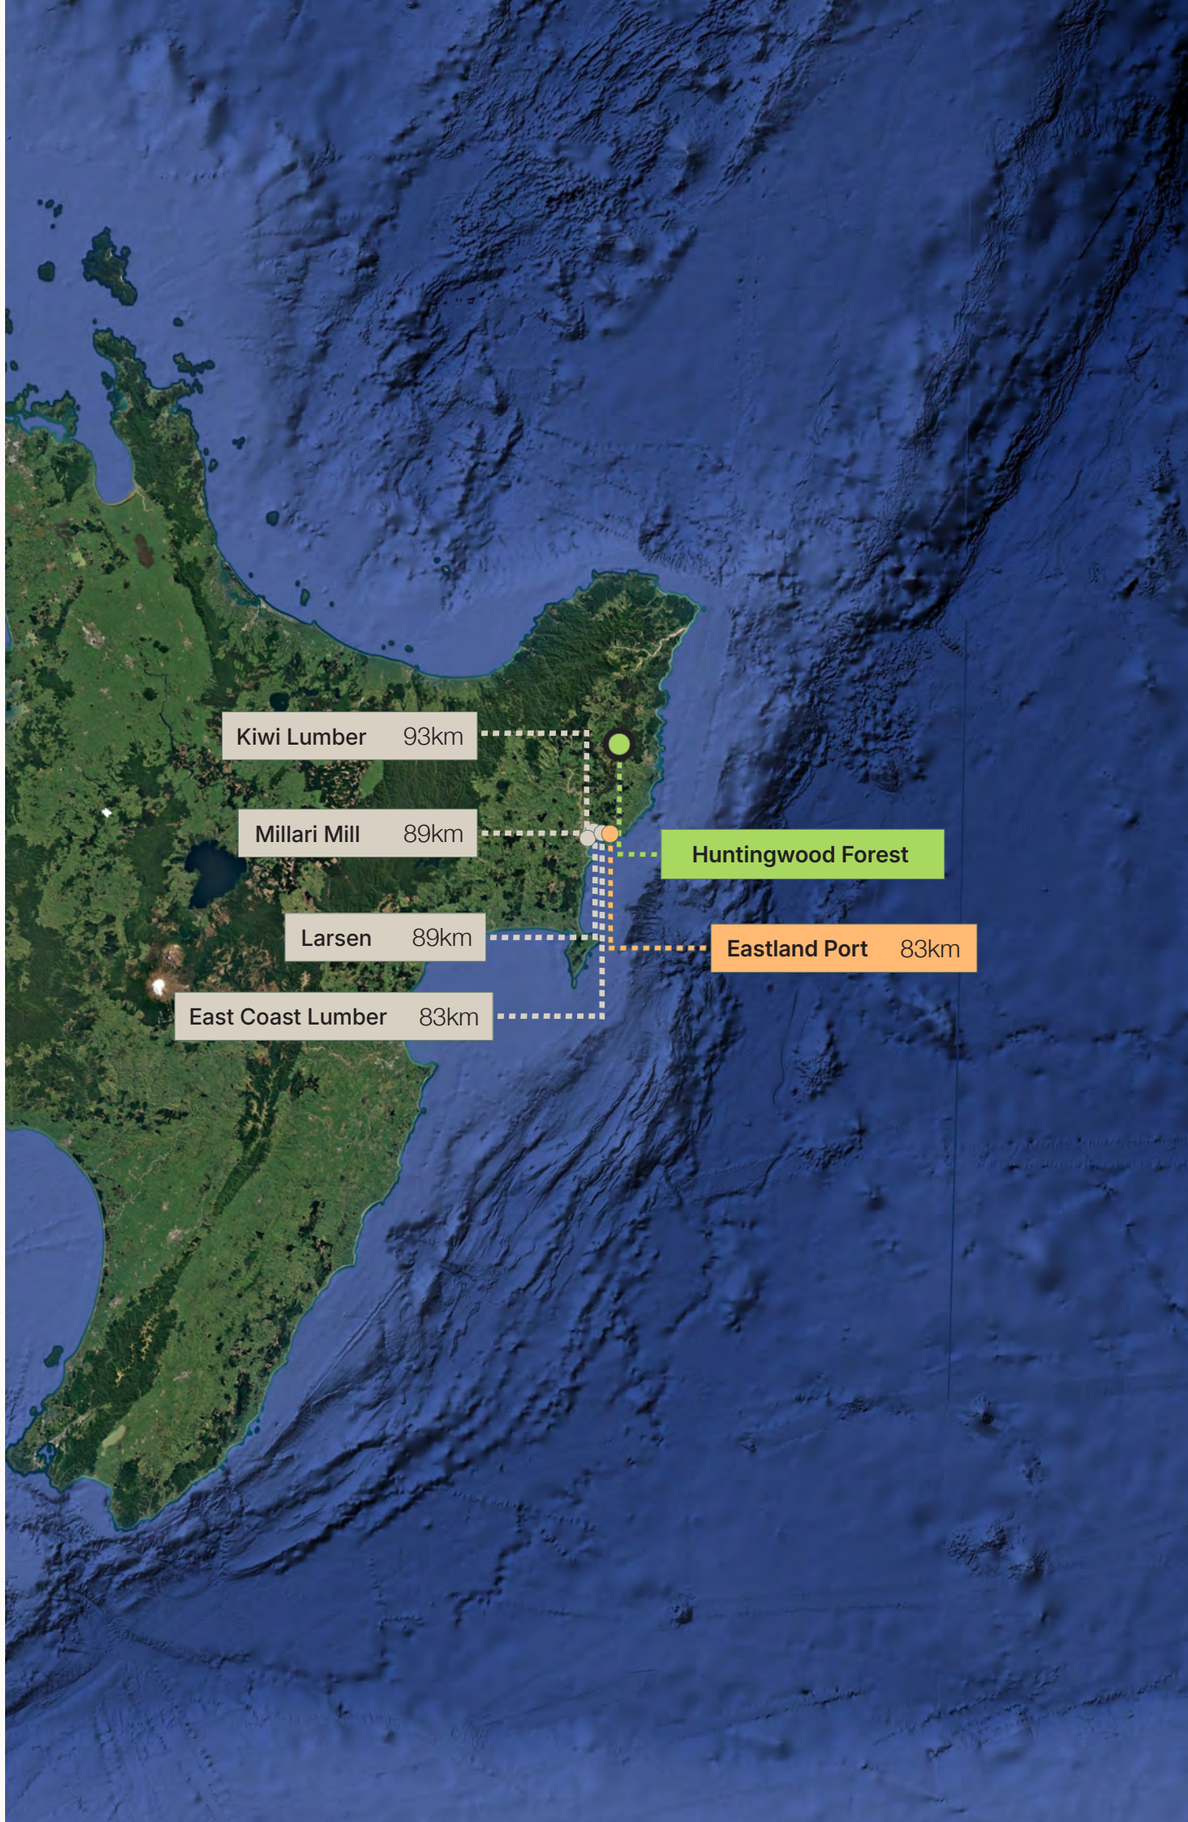

Eastland Port, located in Gisborne city, is New Zealand's second-largest log export port and the most efficient in the country by throughput — handling around three million JAS tonnes per year off a single log berth.

Huntingwood's location places it on established haul corridors to the port. The economical cart distance of approx. 83km, to a high-capacity, single-berth export port directly compresses the stumpage-to-FOB cost line — the single largest variable in net forest revenue. The port's continuous shipping schedule and significant export market presence mean logs move quickly from skid to vessel, minimising inventory holding and wharf-side delay.

In addition to the export channel, the Gisborne region supports local sawmilling capacity. Cartage operators in the district routinely move logs of all grades from East Coast forests to both the port and local mills, providing a domestic offtake alternative for pruned and unpruned logs.

# Emissions Trading Scheme

Huntingwood Forest is registered under New Zealand's Emissions Trading Scheme (ETS) on a stock change basis, earning New Zealand Units (NZUs) as carbon is sequestered through the growing cycle. NZUs can be sold on the open market, providing an additional income stream alongside timber revenues.

Huntingwood Forest has a total of 77.84ha registered across 13 carbon accounting areas (CAAs) providing a passive income across a portion of the forest through carbon trading, while focusing on the harvest of the balance of the stocked area.

All NZUs accrued to date are available to be transferred with the property being 29,098 from the latest Mandatory Emissions Return. This allows for either immediate capital return, or the NZUs can be earmarked for surrender following harvesting of the trees.

With the combination of post-89 registered forest land and un-registered forest, Huntingwood benefits from potential dual income streams through ongoing carbon sequestration with immediate harvest upside also.

## A PURCHASER MAY HAVE A NUMBER OF PATHWAYS AVAILABLE UNDER THE ETS:

### HARVEST AND RE-ESTABLISHMENT

The forest is harvested in accordance with the planned rotation schedule. NZUs must be surrendered at harvest to account for the carbon released. Once the forest is re-established, the sequestration and earning cycle recommences, generating new NZUs over the following rotation.

### PERMANENT CARBON FORESTRY

The forest is managed as a permanent crop rather than a harvest rotation. Under this approach, NZUs continue to accrue indefinitely without a surrender obligation, offering a long-term carbon income strategy. This option foregoes timber revenue but may suit investors with a strong carbon focus, particularly given the growing demand for high-integrity carbon units.

### PAIRED PORTFOLIO STRATEGY

For buyers with existing ETS-registered forests, integrating Huntingwood into a broader carbon portfolio may unlock additional value through the management of surrender obligations and sequestration timing across multiple properties.

**Note:** Full ETS account details, including current unit holdings, registration history, and projected sequestration, are available to registered parties through the private data room.

# Sale Process

## FOR SALE BY NEGOTIATION

This property is to be sold by way of Negotiation with any formal offers to be made on the prescribed form.

## INSPECTIONS

Our Searle Forestry team is happy to facilitate private inspections of the property at a suitable time for all parties.

## DUE DILIGENCE

Further information pertaining to the property is available upon request via a private data room. For a copy of the sale documents please contact the Vendor's exclusive agents below.
